

at least a second aperture to align with an aperture of the computer system exposing a thermal spreader, when the computer system is docked; and

a convective unit to remove internal ambient air to reduce internal ambient air temperature when the computer system is docked, wherein the convection unit forces air into the computer system when the computer system is docked.

3. The apparatus of claim 1, wherein the convection unit exhales air from the computer system when the computer system is docked.
4. The apparatus of claim 1, wherein a temperature of the thermal spreader is reduced via air movement generated by the convention unit.
5. The apparatus of claim 1, wherein the apparatus includes a cooling unit to generate air to forced into the computer system that is of a lower temperature compared to an ambient air temperature within said computer system.
